I ♥ PDF Signature

Audit Trail

This Audit Trail serves as an attestation intended to document the willingness and compliance of the individual(s) included in the Participant section of this document. This is used to link each signatory to the signed document(s). It also provides the repository of collected evidence of each participant.

Definitions of the terms used are provided at the end of this document.

Document evidence and Access

Proposer Name: Ops Ops
Proposer Email: ops@nromomentum.com
Created on: Mar 11, 2026, 8:59:03 PM (UTC)
Completed on: Mar 11, 2026, 9:21:25 PM (UTC)
IP Address: 200.114.112.140
Request Identifier: 33B9416B-AD2A-4F83-9CB2-69F87AA1655C

Digital Signature: Yes
Delivery Mode: Parallel
Number of Validators: 0
Number of Signers: 1
Number of Witness: 0

Signed	4.28.55.97	Mar 11, 2026, 9:21:22 PM (UTC)

Terms definitions

Audit Trail: Also referred to as an "Attestation", an Audit Trail is a document which details specific information relating to each individual involved in the signing process of the uploaded document(s). This is to be used as a record of legal evidence in any juridical proceeding if required.

Request: The process of preparing a document to be signed by one or more people.

Proposer: The person (Name and email address) who prepared the document and initiated the signature request.

IP Address: A unique address that identifies a device on the internet or a local network and can provide more information as to the whereabouts of the signer.

Request Identifier: The unique reference number of the signed document. With this ID, one can search for the document on our website and can validate its authenticity, as well as obtain access to this audit trail and the original document.

Signatory Identifier: The unique identifier of the individual who has signed the document. The UUID (Universally Unique Identifier) is linked only to the signature in the document being referenced by the Request ID on this Audit Trail.

Digital Signature: An additional layer of authenticity which adds a certificate to the signed document. If a document contains a certificate, this indicates that it is embedded with an eIDAS Qualified Timestamp. The signature validity is revoked if the document is tampered with after signing.

Verification check: The requester may provide additional guarantees of integrity for each individual signer. These may include:

- **Email:** The Recipient's email address is validated by sending them a unique link that gives them access to the document.
- **Access Code:** The signer is given a distinct code by the Requester, which they must use in order to open and sign the document.
- **SMS:** A code is automatically generated and sent to the Signer via text message prior to signing.
- **ID Verification:** A code is automatically generated and sent to the Signer via text message prior to signing.

Signature format: The visual style of signature which was used on the document. It can be a typed ('Text'), hand-drawn ('Draw'), or uploaded ('Upload') signature.

Events: Major actions taken by each participant. They include:

- **Sent:** The email request has been sent to the participant.
- **Viewed:** The participant has accepted the Terms and Conditions and Privacy Policy, and viewed the document for the first time.
- **Signed:** The Signer has signed the document.
- **Validated:** The Validator has validated the document.

Participant: Anyone involved in the signing process. They have one of these roles:

- **Signatory:** The person who has been required to sign the document.
- **Validator:** A person who has been given authority to read, and can validate or reject, a document before finalizing the signature process.
- **Witness:** Someone who is asked to acknowledge that the agreement took place. Although they do not interfere in the signing process, they can track and download it at any time.

Qualified Timestamp: A technological instrument which validates that a document was created before a certain date and that has not been modified since then. It is issued by an eIDAS Trusted Service Provider.

Hash (SHA256): It is a combination of letters and numbers which are generated by a cryptographic algorithm to establish a unique value which depends on the contents of the file. SHA256 is the cryptographic algorithm selected to generate the hash.
